

# VERICAST

**Vericast** is a high-performance, patented audio monitoring service for TV, Radio and Internet broadcast. Continuous and precise content tracking guarantees accurate emission of reports, making it one of the most reliable audio identification systems available on the market today.

**Vericast** continuously monitors an audio stream and matches its content against a database of previously extracted reference fingerprints from audio tracks. Results are stored directly into a database, returned as XML formatted data or adapted to the client's specifications for a personalized report.

**Vericast** works with any kind of audio signal, including low quality and distorted audio. It tolerates moderate time-scaling and pitch-shifting, transmission channel noise and ambiance noise such as speech, music and household noises.

**Vericast** can monitor any broadcast channel 24/7/365. The user-friendly application interface allows you to add and remove new content whenever necessary, as well as controlling the identification tasks.

**Vericast** is able to recognize and identify music in series and advertising (background music) as well as detect cover versions of any song.

## ADVANTAGES

- Increase productivity, flexible, precise and robust
- Automated audio content tracking
